AI Tool Prompt Engineering Report

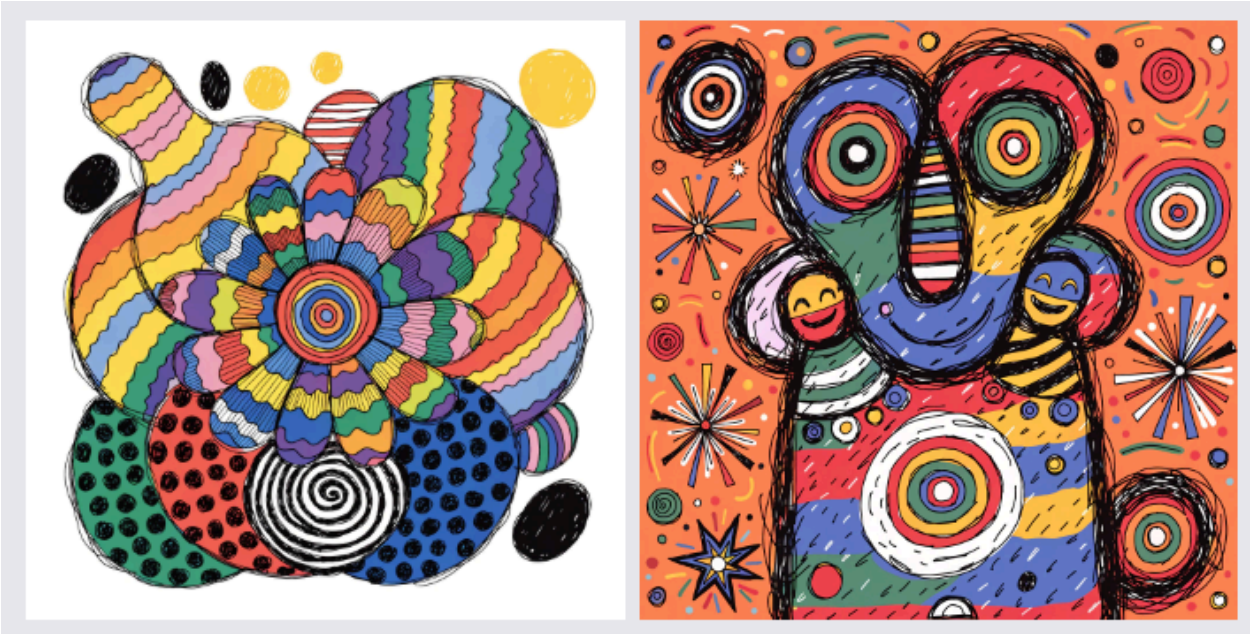
Eril Josh Louis A. Dacanay
BSCS - 2C

Recraft

Recraft is an advanced image synthesis AI tool that utilizes cutting-edge algorithms to generate unique visual content from textual prompts. I chose to focus my observation on Recraft specifically to assess and document the significant progress and rapid advancement of artificial intelligence within the domain of image generation.

Original Prompt

Generate a hand drawn image with bright colors.



AI-Assisted Prompt

I use Gemini to improve my original prompt.

A hand-drawn illustration of a lush botanical garden using vibrant watercolor and ink. Features bright, saturated teals, magentas, and golden yellows. The style should have visible pencil sketches and organic, slightly messy line work for an authentic sketchbook feel.

REFLECTION

The fundamental difference observed between the initial and the AI-assisted output is a striking illustration of how a well-crafted prompt can significantly enhance the quality and accuracy of the generated results. My core objective, which was to produce a hand-drawn image, was only superficially met by the initial, simpler prompt. The AI-assisted prompt, however, proved vastly more effective and useful because it incorporated a wealth of additional detail and specificity.

The improvements in the prompt directly translated into increased clarity and depth in the final output. The refined prompt offered more comprehensive context and specific instructions, remaining entirely relevant to the overarching goal of generating a hand-drawn image. This infusion of detail moved the result from a generic interpretation to a more precise and artistically richer image. The key modifications that yielded these superior results involved explicitly defining the desired specificity of the subject matter, the medium, and the subject matter itself with descriptive adjectives and scene-setting elements.

The major lesson gleaned from this exercise in prompt engineering is the crucial role of prompt structure. Achieving a high-quality, relevant output is not merely about stating a desired object, but about systematically structuring the prompt to include all necessary parameters: the style, the composition, the texture, and the overall mood. This deliberate approach to constructing the prompt is the linchpin for effectively guiding the generative AI to produce results that align closely with the user's creative vision.
